ABSTRACT:

PURPOSE: To simplify the generation of a document for inputting a title by calculating the position of a character frame formed on the document for inputting the title based on the format of title information inputted by an operator.

CONSTITUTION: In case of generating the data of a document picture 14 for inputting the title information, a reference frame 15 for

deciding position,
and next, the picture data of a title document decision
mark 16 is generated
based on the position 85 of a title document decision mark.

Also, a virtual
character frame containing each character pattern is
assumed, and a coordinate
value and character size setting a coordinate reference
point 23 on the left
upward point of each virtual character frame as an origin
are written on a
character frame information table. Next, a file name is
read out, and the
character pattern of the file name 17 is written by the
position 86 of the file
name, and the virtual character frame containing each
character pattern is
assumed, then, the coordinate value and the character frame
size of the frame
are written on the character frame table. Next, the
generation of a guidance
information picture for inputting the character at every
item, etc., is
performed.
